

## DESN 261 - EXERCISE 4 | MOTION FOR INTERFACE

### Brief

---

**Explore the possibilities of motion design for mocking up app interfaces, using Google's material.io guidelines as a launching point.**

Create a micro-motion for a fictional app that explores how the screen can transition from one state to another. How can a simple email open in a graceful way? How can calculator buttons be pressed in a delightful way? Can motion clarify the transition between two different pages? Can a simple on/off toggle be given expression and life?

### Tips

---

- Consider reading over the Material.io document before March 24th's class
- After Effects is powerful, but consider using Figma, XD, or your interface design tool of choice.

### Deliverables

---

- Export as mp4 file in the H.264 Codec

### Schedule

---

This in-class exercise is designed to be completed during March 24th's class.
